

Geofencing Software Research

1. Factorial:

- Pros:
 - Comprehensive HR & business management software with payroll integration
 - Tracks only at clock-in/out for privacy
 - Flexible radius settings
 - Detailed reports and real-time alerts
- Cons:
 - Only works with mobile clock-ins (not desktop)
 - Cannot combine with QR-based entrances simultaneously
- Pricing:
 - Module-Based Pricing Breakdown:
 - Operations Hub (~\$6.90/user/month): Covers foundational HR needs—employee directories, digital signatures, document management, and organizational charts.
 - Time & Attendance Hub (Included in core / up to ~\$8.00 baseline): Unlocks automated timesheets, shift scheduling, time-off/absence management, and the mobile app geofencing check-in framework.
 - People Hub (~\$7.80/user/month): Focuses on talent attraction, performance evaluations, custom onboarding/offboarding workflows, and applicant tracking (ATS).
 - Finance Hub (~\$5.85/user/month): Manages company expenses, custom corporate cards, and mileage tracking.
 - Tiered Service Packages:
 - Basic (\$8 per user/month): Best for lean teams. Unlocks standard employee management, geofenced mobile time tracking, basic document handling, and payroll exports. (Subject to a minimum contract commitment).
 - Business (Custom Quote): Best for scaling teams. Unlocks advanced custom workflows, deeper performance management, automated custom notifications, and advanced payroll analytics.
 - Enterprise (Custom Quote): For large teams requiring custom API integrations, single sign-on (SSO), multi-country entity tracking, and a dedicated account manager.

2. HubStaff:

- Pros:
 - Automatic geofence-based clock-ins/outs

- Strong integrations for project and payroll management
- Real-time workforce visibility
- Detailed productivity reports
- Cons:
 - Only works with mobile clock-ins (not desktop)
 - Cannot combine with QR-based entrances simultaneously
- Pricing: Hubstaff's tiered pricing requires a 2-seat minimum across all paid plans, with an annual billing option that effectively gives you two months free. The entry-level Starter tier costs \$7 per user/month (\$4.99 if billed annually) for basic time tracking and limited tracking metrics. The Grow tier sits at \$9 per user/month (\$7.50 annually), adding advanced reports, budgeting, and a single software integration. Their most popular option, the Team tier, costs \$12 per user/month (\$10 annually) and unlocks full payroll processing, scheduling, and unlimited integrations. The comprehensive Enterprise tier is priced at \$25 per user/month (billed annually only) and bundles specialized features like single sign-on (SSO), data compliance, and automated background tracking. It is important to note that the vital GPS and geofencing module ("Locations") is not included in the standard lower tiers; it must be purchased as a separate add-on starting at \$3.33 per user/month and is restricted to the Team plan or higher

3. QuickBooks Time:

- Pros:
 - Seamless QuickBooks payroll and accounting integration
 - Multiple site support for job-based industries
 - Mobile app prompts employees to clock in/out
 - Detailed project-based reports
- Cons:
 - Reporting can be overwhelming for new users
 - Best value is within QuickBooks ecosystem
- Pricing:
 - Premium (\$20/month base + \$10 per employee/month): Includes standard time tracking via mobile app/kiosk, basic real-time GPS tracking ("Who's Working" dashboard), and shift scheduling alerts.
 - Elite (\$40/month base + \$12 per employee/month): Unlocks the full Geofencing automated boundaries module, real-time project collaboration feeds, mileage tracking, timesheet signatures, and advanced job-costing comparison metrics.

4. Deputy:

- Pros:
 - Combines scheduling, time tracking, and geofencing

- Simple mobile app with shift swapping features
- Affordable compared to enterprise tools
- Cons:
 - Limited advanced GPS tracking
 - Not ideal for project-based companies
- Pricing: Deputy utilizes a per-user, per-month SaaS subscription structure with a mandatory minimum spend policy (typically \$25 to \$30 per month depending on the country). Its standalone foundational plans—Scheduling or Time & Attendance—each start at \$4.50 per user/month if purchased as separate modules. To combine both and get full mobile geofencing alongside shift management, companies usually start on the core Lite plan at \$5 per user/month, scale to the Core tier at \$6.50 per user/month for custom payroll and POS system syncs, or opt for the enterprise-ready Pro tier at \$9 per user/month to unlock advanced analytics and single sign-on (SSO). Additionally, critical backend functionalities are sold as individual modular add-ons, including Messaging+ (\$1.95/user/month to remove the default 10-user group chat limit), Deputy HR (\$2/user/month for digital onboarding and document storage), and Analytics+ (\$1.50/user/month for complex compliance tracking).

5. Clockify:

- Pros:
 - Free plan available (without geofencing)
 - Affordable upgrade for GPS/geofencing
 - Easy interface for small teams and freelancers
- Cons:
 - Limited HR and payroll functions
 - Lacks advanced workforce reporting
- Price: Free (\$0): Unlimited users/projects, manual timers, mobile/desktop apps, and basic text summary exports. Basic (\$3.99 annual / \$4.99 monthly): Unlocks vital admin tools like required fields, bulk entry editing, project templates, and hiding past data from regular users. Standard (\$5.49 annual / \$6.99 monthly): Unlocks timesheet approvals, historical billable invoicing, time-off/leave tracking, manager permissions, and native QuickBooks integration. Pro (\$7.99 annual / \$9.99 monthly): Unlocks the GPS/Location Tracking module, labor cost versus profit forecasting, resource scheduling, task alerts, and project budget boundaries. Enterprise (\$11.99 annual / \$14.99 monthly): Unlocks single sign-on (SSO), data control subdomains, custom user provisioning, and full compliance audit logging. CAKE.com Bundle (\$12.99 annual / \$15.99 monthly): Packages Enterprise Clockify with Pumble (team chat) and Plaky (project management) into a single workspace tool.

6. Mapsly:

- Pros:

- Deep CRM Integrations: Syncs instantly with major platforms (HubSpot, Zoho, Salesforce) and even Google Sheets, mapping data directly into custom fields.
- Flexible Geofencing: Can be set to enforce strict distance rules (blocking check-in if too far), mark entries as "unverified" if out-of-bounds, or automate tracking entirely in the background.
- Adaptive Forms: Prompt employees with dynamic forms upon check-in to collect notes, real-time photo attachments, or e-signatures.
- Advanced Routing Built-In: Perfect for teams that need route optimization and territory management alongside attendance tracking.
- Cons:
 - Steep Learning Curve: Because it is an advanced map automation platform rather than a simple HR clock-in tool, setting up custom check-in scripts requires some configuration.
 - Feature Gatekeeping: Essential automation features (like custom buttons, workflow actions, and advanced multi-user route optimization) are entirely locked behind the more expensive Pro tier.
 - Data Caps: Plans include strict data caps on the number of loaded records, charging extra monthly fees for every additional 10k records.
- Pricing(Per user/month):
 - Essential (\$25): Includes real-time location tracking, standard check-ins, and basic API connectivity. (Caps at 5,000 records).
 - Pro (\$45): Unlocks the no-code automation engine (custom check-in buttons, adaptive forms, automated workflows, and advanced routing). (Caps at 10,000 records).
 - Enterprise (\$70): Unlocks higher API/automation limits, custom single sign-on (SSO), and custom data retention. (Caps at 15,000 records).

7. Time Champ:

- Pros:
 - Double-Layered Security (Anti-Cheating): Combines GPS geofencing with an AI face-recognition selfie check-in. It natively blocks "Fake GPS" and mock location developer apps to prevent time fraud.
 - Complete India-Ready Payroll Sync: It easily calculates local statutory compliances (PF, ESI, TDS, PT) based on the exact geofenced hours logged, turning attendance into payroll with one click.
 - Robust Offline Tracking: If field agents or technicians go into low-connectivity areas or basements, the app securely logs their entry/exit times locally and syncs them automatically when back online.
 - Deep Productivity Monitoring: Outside of geofencing, it tracks app and website usage, idle time, and keystrokes, providing managers with a "Productivity

Calculator" dashboard.

- Cons:
 - Heavy Surveillance Feel: It tracks everything—idle time, active apps, sites visited, and even screen recording/blurring screenshots (on premium tiers). This can feel heavily invasive and hurt employee morale if not rolled out carefully.
 - Rigid Idle-Time Triggers: The system flags an employee as "Idle" if they aren't actively typing or clicking. This can inaccurately flag field employees who are in physical meetings or reading a document on-site.
 - Steep Learning Curve: Because it crams comprehensive HRMS, project management, and screen-monitoring features into one app, configuring custom reports for a small startup can feel overwhelming.
- Pricing(Per User/Month, Billed Annually):
 - Starter (\$3.90): Includes automated geofenced attendance, interactive timesheets, shift configurations, application/website tracking, and basic productivity metrics. (Best for teams up to 50 users).
 - Professional (\$6.90): Unlocks invisible tracking modes, custom idle-time thresholds, task timers, and advanced productivity analytics. (Best for scaling teams up to 1,000 users).
 - Enterprise (\$13.90): Unlocks live status video feeds, blurred screenshots, suspicious activity reports, custom dashboards, GSuite/Active Directory integrations, and a dedicated account manager.

8. 1OfficeView:

- Pros:
 - Complete Smart-Campus Integration: It doesn't just track entries; it connects visitor logs with your entire office infrastructure. A guest checking in can automatically be assigned a pre-booked parking slot, a digital cafeteria meal token, and a QR code to unlock physical security turnstiles.
 - Heavy Enterprise Security & Compliance: Fully compliant with India's DPDP (Digital Personal Data Protection) Act 2023, ensuring guest data is legally handled. It features watchlist screening, NDA document signing on the kiosk screen, and biometric/facial recognition checks.
 - Frictionless "Express Entries": Hosts can pre-register guests via Google Calendar or Outlook. The visitor receives a QR code in advance via email or WhatsApp and passes through physical office security gates in under 30 seconds.
 - Hardware Interoperability: Seamlessly bridges software and physical office hardware. It natively integrates with major global access control hardware (like Honeywell, HID, and Bosch), ANPR (Automatic Number Plate Recognition) cameras for cars, and wall-mounted meeting room tablet displays.

- Cons:
 - Irrelevant for Distant Field Teams: If your startup's employees are field agents, delivery drivers, or working remotely at moving client sites, this software is entirely useless. It requires a fixed physical office or physical kiosk hub to function.
 - Infrastructure Dependency: To extract its full value, it requires a financial investment in hardware like tablet kiosks, badge printers, and access-control wiring.
 - Overly Complex for Micro-Startups: If you only want to register 5 to 10 visitors a week at a small co-working desk space, the enterprise-grade configurations and onboarding pipeline will feel like massive administrative overkill.
- Pricing:
 - Custom Quote / Enterprise Only: 1OfficeView operates entirely on a B2B Custom Pricing Model based on the number of physical campus locations, active kiosks deployed, and the specific modules you add (Modular Setup: VMS, Cafeteria, Meeting Rooms, or Parking). They do not offer transparent off-the-shelf pricing tiers, meaning you must book a corporate demo to get a tailored contract quotation.

9. EmpMonitor:

- Pros:
 - Extensive Monitoring Capabilities: Beyond basic clock-ins, it tracks precise website and app usage, registers keystrokes, tracks browser histories, and captures automated periodic screenshots of employee screens.
 - Volume-Based, Scalable Brackets: Its pricing model is highly friendly to scaling teams. Instead of charging flat, expensive per-user rates, the cost per seat decreases significantly as your team headcount grows.
 - Versatile Deployment (Stealth Mode): It can be deployed via Active Directory across an entire fleet and supports a "Stealth Mode" where the tracking agent runs invisibly in the background without a taskbar icon.
 - Security & Data Loss Prevention (DLP): Includes enterprise-grade security features like IP whitelisting, USB device detection, and network folder monitoring to safeguard corporate data against insider leaks.
- Cons:
 - Heavy Micromanagement Tooling: Because it logs keystrokes and captures screenshots, it sits heavily on the invasive side of surveillance. It requires careful internal transparency to avoid damaging employee morale and trust.
 - Aggressive/Rigid Idle Calculations: The software tracks mouse and keyboard movement to measure activity. Users note that it can occasionally miscategorize productive, non-typing tasks (like reading a long brief or an off-screen meeting) as "Idle Time," skewing metrics.

- **Dense Dashboard Interface:** The admin command center prioritizes raw data density over actionable summaries. Sifting through timeline charts and screenshot logs to build highly customized attendance reports can involve a learning curve.
- **Pricing(Per User/Month, Billed Annually):**
All tiers unlock the complete core feature set; prices shift strictly based on your total seat brackets.
- **Bronze (\$4.66):** Entry-level tier for small teams of 1 to 10 users.
- **Silver (\$3.83):** Standard growth tier for mid-sized teams of 11 to 50 users.
- **Gold (\$3.00):** Best-value tier for expanding teams of 51 to 200 users.
- **Diamond (Custom Quote):** Enterprise tier for heavy deployment across 200+ users with dedicated onboarding support.

10. Unolo:

- **Pros:**
 - **95% Accurate Distance & Auto-Conveyance Tracking:** It automatically calculates the exact distance traveled by an employee during their shift using GPS. It converts this mileage directly into conveyance expense claims, preventing inflated travel bills.
 - **Aggressive Anti-Tamper Security:** Unolo has highly robust protocols to prevent cheating. It detects and blocks "Fake GPS" or mock location apps, stops functioning if an employee manually changes their phone's date/time settings, and pings managers if an agent turns off their location services.
 - **Geo-Verified Client Visits & Forms:** When an employee arrives at a customer site, they can book orders on the go, fill out custom reporting forms, and upload photos that are automatically geo-tagged and time-stamped.
 - **Beat/Route Optimization:** Includes Permanent Journey Plans (PJP) or "Beat Planning" tools that map out the most fuel-efficient and logical physical route for a field agent to visit multiple clients in a day.
 - **Works Flawlessly Offline:** If your team works in remote zones or basements with zero internet, the app securely logs GPS location data locally and automatically syncs it to the manager's dashboard the moment connection is restored.
- **Cons:**
 - **Tedious First-Time Configuration:** Setting up background location permissions across different Android smartphone manufacturers (Xiaomi, Samsung, OnePlus) sometimes requires manual tweaking during deployment.
 - **Inconsistent Support Experiences:** While many users report great tech support, some early-stage users note that resolving unique, edge-case synchronization errors via customer service can occasionally experience minor delays.
 - **No Built-In Client Invoicing:** While it tracks sales, expenses, and order bookings seamlessly, it lacks a direct client invoice generator, requiring you to pipe the data into

an external accounting app.

- Pricing(Per User/Month):
 - Attendance & Tracking (\$5): Includes real-time location monitoring, background geofencing, digital attendance, leaves management, and downloadable past data/CSV reports.
 - Basic (\$10): Unlocks all attendance features plus optimization modules including the client database, automated task assignments, custom field data forms, expense tracking, and automated conveyance claims.
